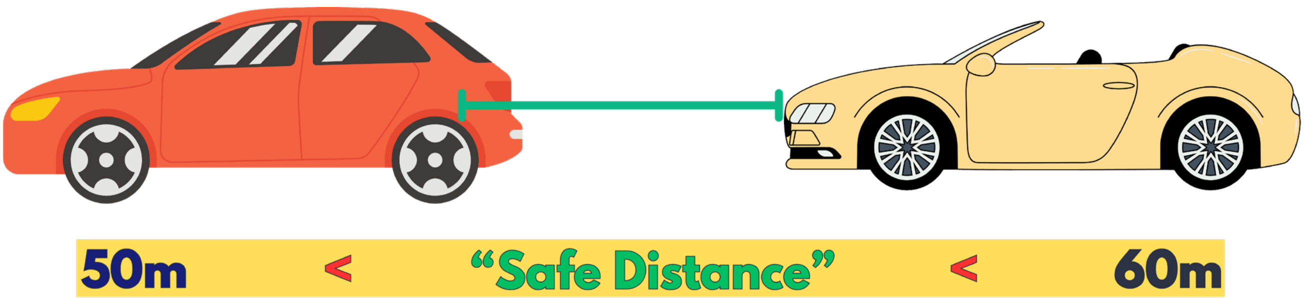
UNIT 6 EXPANDING KNOWLEDGE ON THE TOPIC

Mathematical Expressions in Self-Driving Cars

Self-driving cars use mathematical expressions like "greater than or equal to" and "less than or equal to" to make crucial driving decisions. For example, if a car's sensor detects an object within a distance that is "less than or equal to" five meters, the car might automatically slow down or stop to prevent a collision. These expressions help program the algorithms that control the car's responses to its environment, such as maintaining a speed "less than or equal to" the speed limit, or keeping a safe distance from other vehicles.



By setting precise thresholds for actions using these mathematical terms, engineers ensure that self-driving cars operate safely and efficiently within defined limits.

This integration of mathematics into technology not only advances automotive capabilities but also demonstrates the significant role math plays in driving innovations that impact our daily lives. Understanding these expressions provides a foundation for appreciating and engaging with future technological developments.

THINK ABOUT IT!

Why is it important to learn and study technologies? It' s not just about preparing for college! Consider the broader reasons!
