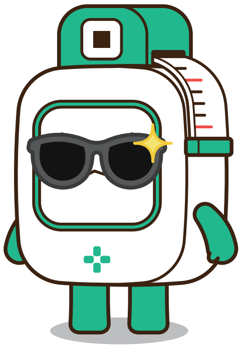
UNIT 4 DIVE INTO FLOW: THE SCIENCE BEHIND CUTTING WOOD

HOW DOES CUTTING WORK?

Cutting wood might seem simple, but there's a lot of science behind it! You're using force to break the material into smaller pieces when you cut something. Wood is a rigid material, so cutting it requires a strong force. That's why machines like the Wood Cutter help—they can apply more force than our hands can.



WHAT IS FORCE?

Force is the push or pull on an object that makes it move or change shape. When you cut wood, the knife pushes down, and the force helps split the wood apart. The sharper the blade, the easier it is to cut because the sharp edge focuses the force on a small area.

HOW DOES A MACHINE HELP?

A machine like our Wood Cutter makes cutting easier by using motors to do the work for us. Instead of using your muscles, the motor uses energy from a battery to move the knife. This makes cutting faster and requires less effort from you. The motor in the Wood Cutter moves the knife up and down repeatedly, creating a steady cutting motion.

Multiple Choice Questions

1 What does an automatic system do?

Ⓐ Requires you to do everything by hand
Ⓑ Works by itself without needing much help from people
Ⓒ Makes things slower
Ⓓ Only works if you push it constantly

CORRECT ANSWER Ⓑ

2 What is the main advantage of using an automatic wood cutter?

Ⓐ It requires more effort to use
Ⓑ It makes cutting slower
Ⓒ It cuts wood faster and with less effort
Ⓓ It can only cut one type of wood

CORRECT ANSWER Ⓒ

3 Which module can adjust the angle and move?

Ⓐ Button
Ⓑ IMU
Ⓒ Network
Ⓓ Motor A

CORRECT ANSWER Ⓐ

Reflection Questions

1 Why do you think people invented automated systems like the elevator?

2 What would happen if we didn’ t have automated machines? How would that change the way we work?

3 If you could design your own automated machine, what would it do, and how would it help you or others?
