UNIT 4 BUILDING BLOCKS

Blocks of ToF

The ToF (Time of Flight) module, an input type, comes with 3 blocks in the Code Editor.

Blocks of Motor A

The output module, Display, is all about taking action. It has blocks specifically designed for showing pictures, text, or variable values on the screen. There are also blocks that allow you to move the displayed content around, and one important block that resets or initializes the Display for a fresh start.

● Negative Values of Motor Speed

Setting the motor speed to -50% makes it spin counter-clockwise. Positive speeds result in clockwise rotation.

● Linking Motor Speed to ToF's Data

By linking the motor speed to the ToF Sensor's distance data, the motor's speed varies with the proximity of objects to the sensor.

TIPS

To prepare MODI for a new set of code, simply press the 'Initialize' button. You'll know MODI is ready when the status LED on the module turns blue.
