UNIT 3 DESIGNING SOLUTIONS

● Programming Concepts

Variables are like labeled containers in a computer program where we store information that our code needs to use repeatedly, such as numbers, names, or even colors. They act like memory spots that hold onto this data so we can use it, change it, or check it whenever needed.

✓ VARIABLES

By using variables, we can make our code more flexible and intelligent, allowing it to respond differently under various conditions based on the information stored in these variables.

LET'S MAKE A VARIABLE IN CODE EDITOR:

Step1

Go to the Variables section and click "Create Variable."

MODI Planet | Code Editor

block

- Setup
- Input
- Output
- Time
- Logic
- Repeat
- Operators
- Variables

Create variable

variable ▾

set

variable ▾

to

0

variable ▾

1

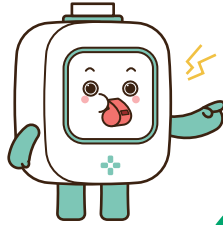

addition

This!

Step2

Type the name for your variable (like "mode").

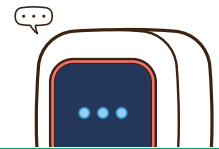

Step3

After typing the name, click "Make" to create it.

Step4

You'll then see your new variable in the list.

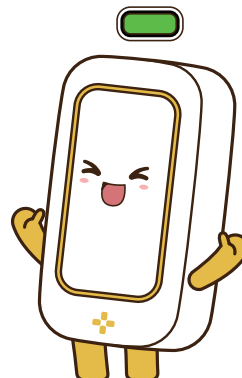

Step5

Click on the area where variables are shown to see the one you made.

variable ▼

- ✓ mode
- variable
- Renames variable...
- Delete the 'variable' variables

Flowcharts & Algorithms

Let's read the flowchart and create the code.
