UNIT 4 CODE QUEST

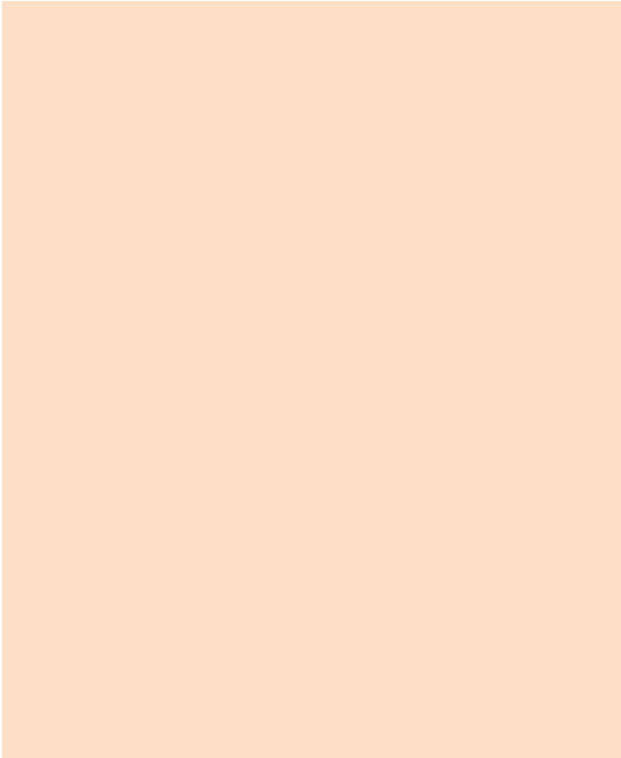

Applying Knowledge (code & debugging)

CODE

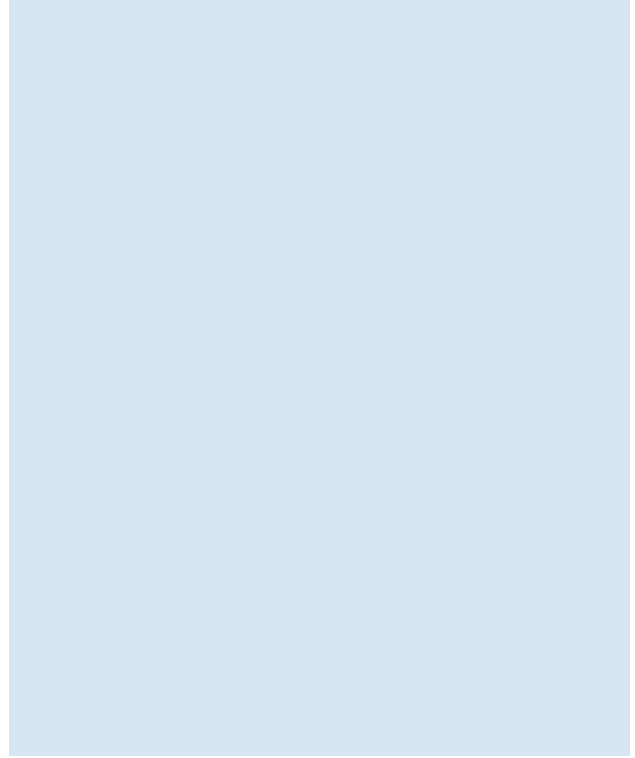

DEBUGGING

1 What if we remove the wait block from the sequence?

2 What if we replace the nested if statements with a while loop?

Missions

Mission 1: Display Control Based on

Write a code that displays "STOP" on the screen when the traffic light color is either red or orange, and "GO" when the color is green. This will help simulate real-world traffic light functions.

Mission 2: Advanced Interaction with the Traffic Light

Implement an on/off toggle function for the traffic light system using a double-click mechanism. This feature allows the traffic light to be turned on or off with a quick double-click, adding a realistic control feature to the model.
