UNIT 1 EXPLORING THE CORE

Topic Investigation

THE IMPORTANCE OF FIRE SAFETY

Fire safety is crucial for protecting lives, homes, and the environment. Fires can start quickly and spread even faster, causing significant damage and putting people in danger. Understanding how to prevent fires and what to do if one occurs can save lives. In this unit, you'll learn about the basics of fire safety, including what causes fires, how they spread, and the importance of early detection.

Have you witnessed any forest or building fire causing human or wildlife evacuation?

WHAT CAUSES FIRES?**1. HEAT SOURCES**

Fires need heat to start. This can come from sources like matches, lighters, stoves, and even the sun. If heat comes into contact with something that can burn, a fire can start.

**2. FUEL**

Fuel is anything that can burn, such as wood, paper, or fabric. The more fuel a fire has, the faster it can grow and spread.

**3. OXYGEN**

Fires need oxygen to keep burning. Without enough oxygen, a fire will go out. However, with plenty of oxygen, fires can become very dangerous very quickly.

**Trivial Question:**

Have you ever played with matches or a lighter, maybe just to see what would happen? What did you notice, and how did it make you feel?

Common Fire Hazards

ELECTRICAL FIRES:

- Overloaded circuits, faulty wiring, or damaged appliances can cause electrical fires. It's important to use electricity safely and have regular checks on wiring and electrical equipment.

KITCHEN FIRES:

- The kitchen is one of the most common places where fires start. Grease fires can occur if cooking oil becomes too hot, and fires can start if flammable materials are too close to a heat source.

OUTDOOR FIRES:

- Fires can also start outdoors, especially in dry, hot conditions. Campfires, barbecues, and fireworks can all be fire hazards if not handled properly.

Can you think of any fire hazards in your own home or school? How could you make those places safer?

Questioning the Details

INTERACTIVE ACTIVITY: SPOT THE FIRE HAZARDS

Below is an image of a typical room. Circle the fire hazards you can find! (You could include an illustration of a room with potential fire hazards, such as frayed wires, a candle left unattended, or a space heater near curtains.)

DID YOU KNOW?

Most house fires start in the kitchen, usually because of unattended cooking. That's why it's important to never leave your stove or oven on when you're not in the room!

QUESTIONING

Q1 Why is it important to identify potential fire hazards in places like your home or school before a fire starts?

Q1 What could happen if fire hazards are ignored, and how might it impact people, animals, and the environment?

Inquiry & Reflection

Discussion question 1

How do you think understanding fire safety can help you protect not just yourself, but also your family and friends?

Discussion question 2

If you could design a fire safety plan for your home or school, what would be the most important steps to include, and why?
