UNIT 3 DESIGNING SOLUTIONS

● Programming Concepts

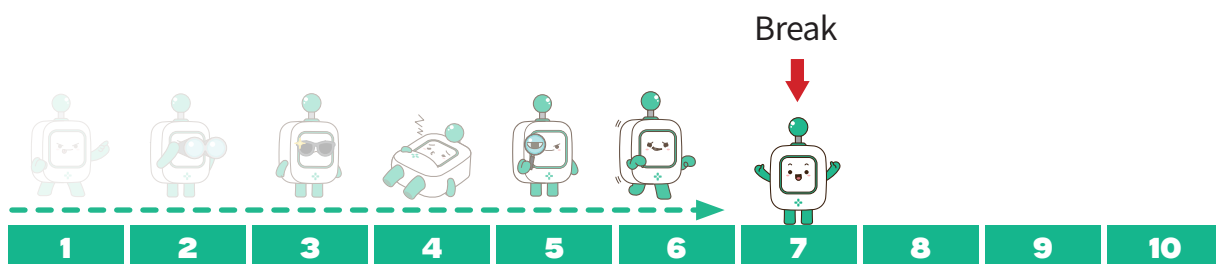

BREAKING OUT: UNDERSTANDING BREAK STATEMENTS

Imagine you're playing a board game. If you land on a "Go to Jail" square, you must stop moving and follow a particular rule. A break statement is like that "Go to Jail" square in programming. It tells the computer to stop running and jump out of a particular code block.

What is a Loop? Before we talk more about break statements, let's quickly review loops. A loop is a way to repeat a code block several times or until a condition is met. For example, you could use a loop to print the numbers from 1 to 10.

When to Use a Break Statement: You might use a break statement when:

- **You've found what you're looking for:** If you look at a list of numbers and

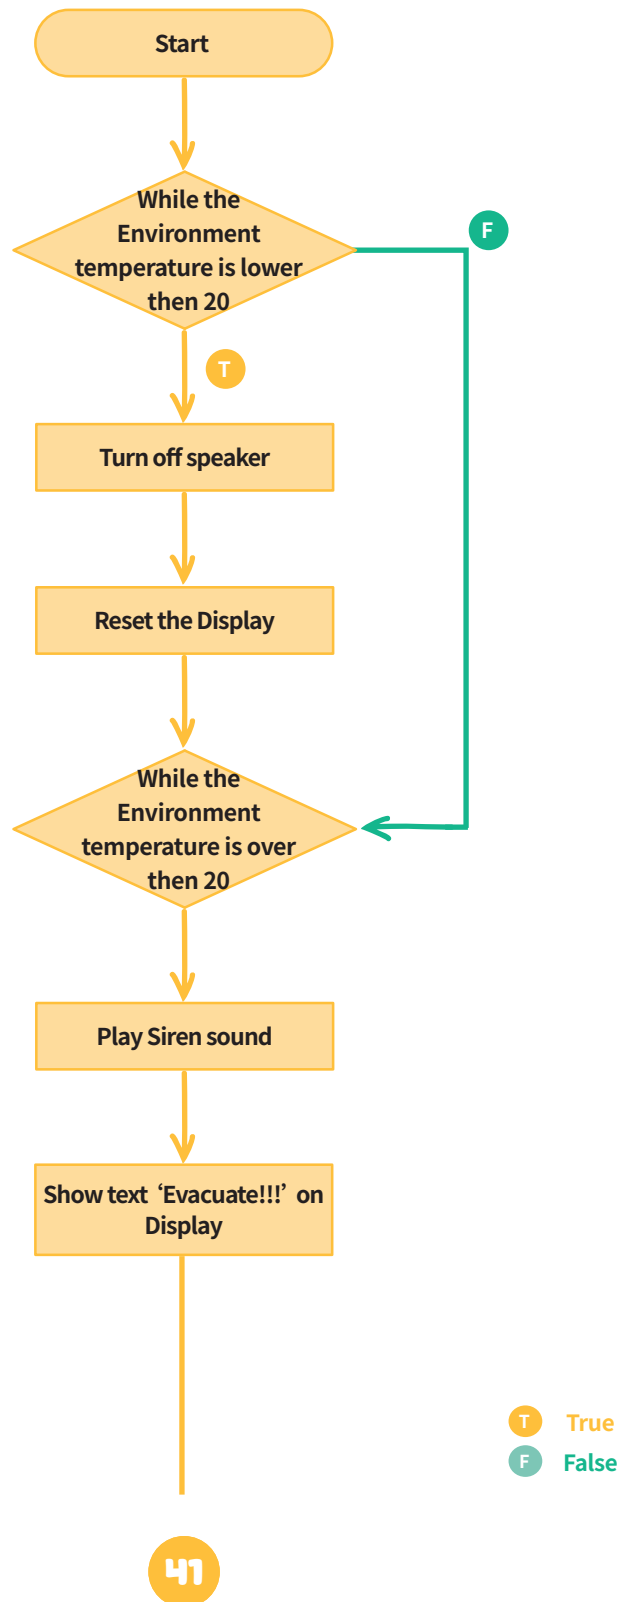

- **You want to exit a loop early:** If something unexpected happens, you can use a break to exit the loop and handle the situation.

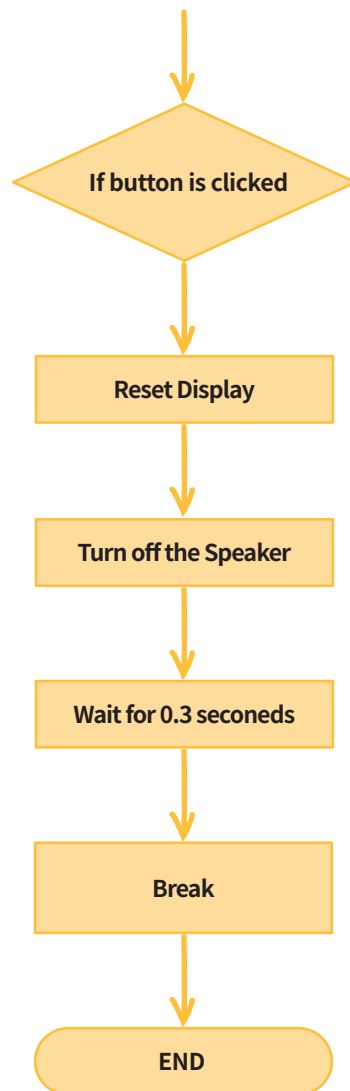

Flowcharts & Algorithms

Let's read the flowchart and create the code.
