## UNIT 2 UNDERSTANDING ANGLES

### WHAT IS AN ANGLE?

An angle is formed when two straight lines meet at a point, which we call the "vertex." Angles show us how much space is between the two lines. They can be big or small, depending on how far apart the lines are from each other.

Let's explore some easy examples to understand angles better.

## EXAMPLES OF ANGLES IN EVERYDAY LIFE

**360 DEGREES** A Full Circle. Imagine a Pizza. If you have a whole pizza, you have a circle representing a 360-degree angle.

**180 DEGREES** A Half Circle. Now, think about folding that pizza in half. If you cut the pizza straight through the middle, you've divided it into two equal parts.

**45 DEGREES** A Pizza Slice. Let's take a slice of that pizza now. A slice of pizza usually forms a small angle at the tip where the two edges meet. If the pizza is cut into 8 equal slices, each slice has an angle of about 45 degrees.

## ● Activity: 45-degree pizza slice

---

How about a 45-degree pizza slice? Let's draw it with lines and then cut it out!

## Let's think about more

Imagine someone standing at a 45-degree angle. Let's identify which modules they would be between. Mark the 45-degree position and determine which modules are on either side.
