COMPUTER INTRODUCTION

UNIT 1 CONCEPT OF COMPUTERS.

WHAT IS A COMPUTER?

Imagine a computer as a brilliant friend that can help us with many things. It's like having a super helper who can do many tasks for us.

BASIC PARTS OF A COMPUTER:

Many parts work together inside a computer, just like a big team! One important part is the CPU, which is the brain of a computer. Then there's memory, like the computer's short-term memory, where it remembers things

temporarily. And there's storage, which is like a big cabinet where the computer keeps all its files and programs.

We can also see and touch the screen, keyboard, and mouse.

- **SCREEN:** The screen is like a TV. It shows us pictures, videos, and everything we do on the computer. We look at the screen to see everything when we play a game or watch a video.

Screen

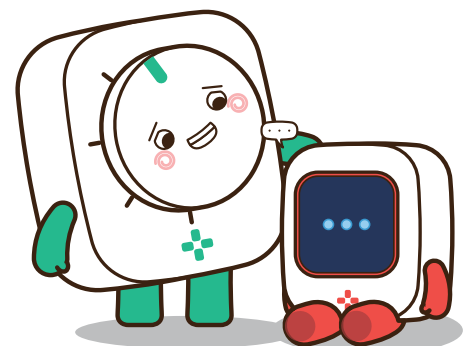

Keyboard

Mouse

- **KEYBOARD:** The keyboard is a set of keys, like a typewriter, that we press to type letters, numbers, and symbols. It's how we write messages, do homework, or search for things on the internet. Each key has a different letter or number; when we press them, they appear on the screen.
- **MOUSE:** The mouse is a small device that moves with our hands. It helps us to point and click on things on the screen and open files or play games. It usually has two buttons and sometimes a scroll wheel in the middle to help us move up and down a page.

These parts help us tell the computer what we want it to do. We look at the screen to see what's happening, use the keyboard to type words and numbers and move the mouse to click on things.

Let's find out

Let's find and circle the mouse in this picture.

TYPES OF COMPUTERS:

Desktop

Laptop

Tablet

Smartphone

There are different kinds of computers for various jobs. Some are big and powerful, like those in schools or offices (desktops), whereas some are smaller and portable, like laptops that we can carry around. There are even smaller ones, such as tablets and phones, in our hands.
